

OpenMP 6.0 API Syntax Reference Guide

The OpenMP® API is a scalable model that gives programmers a simple and flexible interface for developing portable parallel applications in C/C++ and

Fortran. OpenMP is suitable for a range of algorithms running on multicore nodes and chips, NUMA systems, GPUs, and other such devices attached to a CPU.

OpenMP code examples

An Examples Document and a link to a GitHub repository with code samples is at openmp.org/specifications.

OpenMP directive format

A directive is a combination of the base-language mechanism and a directive-specification (directive-name followed by optional clauses). A construct consists of a directive and, often, additional base language code.

c/C++ C/C++ directives are formed with pragmas alone or pragmas with attributes.

Fortran directives are formed with comments in free form and fixed form sources (codes).

See [5] [5] for details about the directive format. Examples:

c/c++ #pragma omp directive-specification

[[omp :: directive(directive-specification)]]

[[using omp : directive(directive-specification)]]

!\$omp directive-specification

!\$omp directive-specification !\$omp end directive-name

Directives and Constructs

OpenMP constructs consist of a directive and, if defined in the syntax, a following structured block. An underscore is required in the directive name unless indicated with . • OpenMP directives except simd and any declarative directive may not appear in Fortran PURE procedures. • structured-block is a construct or block of executable statements with a single entry at the top and a single exit at the bottom. • strictly-structured-block is a structured block that is a Fortran BLOCK construct. • loosely-structured-block is a structured block that is not strictly structured and doesn't start with a Fortran BLOCK construct. • omp-integer-expression is of a C/C++ scalar int type or Fortran scalar integer type. • omp-logical-expression is a C/C++ scalar expression or Fortran logical expression.

Data environment directives

threadprivate [7.3] [5.2]

Specifies that variables are replicated, with each thread having its own copy. Each copy of a threadprivate variable is initialized once prior to the first reference to that copy.

list:

c/c++ A comma-separated list of file-scope, namespace-scope, or static block-scope variables that do not have incomplete types.

For A comma-separated list of named variables and named common blocks. Common block names must appear between slashes.

declare_reduction [7.6.14] [5.5.11]

Declares a reduction-identifier that can be used in a reduction, in reduction, or task reduction clause.

Ŧ	<pre>#pragma omp declare_reduction (reduction-identifier : typename-list) [clause[[,] clause]</pre>	
5	typename-list) [clause[[,] clause]	
5 !\$omp declare_reduction &		
モ	(reduction-identifier : typename-list)	

[clause[[,] clause]

reduction-identifier:

c/c++ A base language identifier (for c), or an id-expression (for C++), or one of the following operators: +, *, &, |, ^, &&, ||

For A base language identifier, user-defined operator, or one of the following operators: +, *, .and., .or., .eqv., .negv.; or one of the following intrinsic procedure names: max, min, iand, ior,

c/c++ typename-list: A list of type names

For typename-list: A list of type specifiers that must not be CLASS(*) or abstract type.

clause:

combiner (combiner-expr)

combiner-expr (REQUIRED)

c/c++ An expression including function calls

For An assignment statement or a subroutine name with an argument list.

Use omp_out as the result, and omp_in and omp_out as the two input operands for the reduction operation.

CONTINUES IN NEXT COLUMN >

declare reduction (continued)

initializer (initializer-expr)

initializer-expr: omp priv = initializer or function-name (argument-list)

declare induction [7.6.17]

Declares an induction-identifier that can used in the induction clause.

#pragma omp declare_induction (induction-identifier: type-specifier-list) clause [,] clause

!\$omp declare_induction (induction-identifier: type-list) clause [,] clause

clause:

Both the collector and inductor clauses must be specified. **collector** (collector-expression)

> collector-expression: expression, use omp_idx for loop counter and **omp_step** for loop increment.

inductor (inductor-expression)

inductor-expression: omp_var = expression, use omp_var for induction variable and omp_step for loop increment.

scan [7.7] [5.6]

Specifies that scan computations update the list items on each iteration of an enclosing loop nest associated with a worksharing-loop, worksharing-loop SIMD, or simd directive.

C/C++	{ structured-block-sequence [#pragma omp scan init-complete-clause] structured-block-sequence #pragma omp scan scan-clause structured-block-sequence }
Fortran	structured-block-sequence [!\$omp scan init-complete-clause] structured-block-sequence #!\$omp scan scan-clause structured-block-sequence
clau	SP:

scan-clause

exclusive (list)

inclusive (list)

init-complete-clause

init_complete (omp-constant-logical-expression)

declare mapper [7.9.10] [5.8.8] ■

Declares a user-defined mapper for a given type, and may define a mapper-identifier for use in a map clause.

C/C++	#pragma omp declare_mapper ([mapper-identifier:] type var) [clause[[,] clause]]
For	!\$omp declare_mapper ([mapper-identifier:]type::var) & [clause[[,] clause]]

clause:

map ([[map-modifier, [map-modifier, ...]] map-type :] list) 🖪

map-type: storage, from, to, tofrom

map-modifier: always, close, present, mapper(default), iterator(iterator-definitions)

mapper-identifier:

A base-language identifier or default 🖪

type: A valid type in scope var: A valid base-language identifier

groupprivate [7.13]

Distribute the list items such that each contention group receives its own copy.

	. ,
c/C++	#pragma omp groupprivate [clause]
For	!\$omp declare groupprivate [clause]
-1	

device_type (host | nohost | any)

Specify type of device for which a version of the procedure or variable should be made available.

Memory management directives

Memory spaces [8.1] [6.1]

Predefined memory spaces represent storage resources for storage and retrieval of variables.

Memory space	Storage selection intent
omp_default_mem_space	System default storage
omp_large_cap_mem_space	Storage with large capacity
omp_const_mem_space	Storage best for constant-value variables
omp_high_bw_mem_space	Storage with high bandwidth
omp_low_lat_mem_space	Storage with low latency

Continued

OMP1124 © 2024 OpenMP ARB

allocate 18.51 [6.6]

Specifies how a set of variables is allocated.

	#pragma omp allocate (list) [clause[[,]clause]]
For	!\$omp allocate (list) [clause[[,]clause]]

clause:

align (alignment)

alignment: An integer power of 2.

allocator (allocator)

allocator:

c/C++ type omp_allocator_handle_t For kind omp_allocator_handle_kind

allocators [8.7] [6.7]

Specifies that OpenMP memory allocators are used for certain variables that are allocated by the associated allocate-stmt.

!\$omp allocators [clause] allocate-stmt [!\$omp end allocators]

clause: allocate @

allocate-stmt: A Fortran ALLOCATE statement.

Variant directives

[begin]metadirective [9.4.3-4] [7.4.3-4]

A directive that can specify multiple directive variants, one of which may be conditionally selected to replace the metadirective based on the enclosing OpenMP context.

		#pragma omp metadirective [clause[[,] clause]]
	±	- or -
	c/c	#pragma omp begin metadirective [clause[[,] clause] . stmt(s)
		#pragma omp end metadirective
Fortran		!\$omp metadirective [clause[[,] clause]]
	- or -	
	Fortr	!\$omp begin metadirective [clause[[,] clause]]

clause

when (context-selector-specification: [directive-

Conditionally select a directive variant.

otherwise ([directive-variant])

!\$omp end metadirective

Conditionally select a directive variant. otherwise was named default in previous

[begin]declare_variant [9.6.4-5] [7.5.4-5]

Declares a specialized variant of a base function and the context in which it is used.

#pragma omp declare_variant(variant-func-id) \ clause [[[,] clause] ...] [#pragma omp declare_variant(variant-func-id) \ clause [[[,] clause] ...] function definition or declaration #pragma omp begin declare_variant match-clause declaration-definition-seq #pragma omp end declare_variant !\$omp declare variant ([base-proc-name:] & variant-proc-name) clause [[[,] clause]...]

clause

adjust_args (adjust-op: argument-list)

Specifies how to adjust the arguments of the base function when a specified variant function is selected for replacement.

adjust-op: need_device_addr, need_device_ptr, nothing

[begin]declare_variant (continued)

append_args (append-op[[, append-op]...]) Specifies additional argument to append to the argument list of the call to the variant function append-op: interop (

interop-type[[, interop-type]...])

match (context-selector-specification)

Specifies conditions in which variant function is selected for replacement.

match (context-selector-specification)

REQUIRED. Same as above

C/C++ variant-func-id

The name of a function variant that is a base language identifier, or for C++, a template-id.

For variant-proc-name

The name of a function variant that is a base language identifier.

dispatch [9.7] [7.6]

Controls whether variant substitution occurs for a function call in the structured block.

#pragma omp dispatch [clause [[,] clause] ...] function-dispatch-structured-block !\$omp dispatch [clause [[,] clause] ...] function-dispatch-structured-block [!\$omp end dispatch]

depend ([depend-modifier,] dependence-type: locator-list) ■

device (omp-integer-expression)

Identifies the target device that is associated with a device construct.

interop (interop-var-list)

is_device_ptr (list)

list: device pointers

has device addr (list-items) nocontext (omp-logical-expression)

If omp-logical-expression evaluates to true, the construct is not added to the construct set of the OpenMP context.

novariants (omp-logical-expression)

If omp-logical-expression evaluates to true, no function variant is selected for the call in the applicable dispatch region.

nowait 🖪

declare_simd [9.8] [7.7] ■

Applied to a function or subroutine to enable creation of one or more versions to process multiple arguments using SIMD instructions from a single invocation in a SIMD loop.

#pragma omp declare_simd [clause[[,]clause] ...]

clauses:

aligned (argument-list[: alignment])

Declares one or more list items to be aligned to the specified number of bytes.

alignment: Optional constant positive integer

linear (linear-list[: linear-step]) ■ simdlen (length)

Specifies the preferred number of iterations to be executed concurrently.

uniform (argument-list)

Declares arguments to have an invariant value for all concurrent invocations of the function in the execution of a single SIMD loop.

[begin]declare_target [9.9.1-2] [7.8.1-2] ■

A declarative directive that specifies that variables, functions, and subroutines are mapped to a device.

#pragma omp declare_target (extended-list) #pragma omp declare_target clause[[,]clause ...] #pragma omp begin declare_target \ [clause[[,]clause] ...] declarations-definition-seq #pragma omp end declare_target !\$omp declare_target (extended-list) !\$omp declare_target [clause[[,]clause] ...]

clause

device_type (host | nohost | any)

Specify type of device for which a version of the procedure or variable should be made available.

enter (extended-list)

A comma-separated list of named variables, procedure names, and named common blocks.

indirect[(invoked-by-fptr)]

Determines if the procedures in an **enter** clause may be invoked indirectly.

link (list)

Supports compilation of functions called in a target region that refer to the list items.

local (list-items)

Specify that references to list-items refer to a local copy of the list-items on the device.

- For the second c/C++ form of declare target, at least one clause must be enter or link.
- For begin declare_target, only the clauses indirect and device type are permitted.

Informational and utility directives

requires [10.5] [8.2]

Specifies the features that an implementation must provide in order for the code to compile and to execute correctly.

clause

atomic_default_mem_order (seq_cst | acq_rel | relaxed)

Requires that implementation uses the specified memory ordering for atomic constructs that do not specify a memory-order clause.

device_safesync

Requires that synchronizing divergent threads in a team can make progress on a non-host device, unless a safesync clause is specified.

dynamic_allocators

Enables memory allocators to be used in a target region without specifying the uses_allocators clause on the corresponding target construct. (See target on page 5 of this guide.)

reverse_offload

Requires an implementation to guarantee that if a target construct specifies a device clause in which the ancestor modifier appears, the target region can execute on the parent device of an enclosing target region. (See target on page 5.)

Requires that all map clauses of map-entering directives have an implicit self modifier.

unified address

Requires that all devices accessible through OpenMP API routines and directives use a unified address space.

unified shared memory

Guarantees that in addition to the requirement of unified address, storage locations in memory are accessible to threads on all available devices.

CONTINUES IN NEXT COLUMN >

assume, [begin]assumes [10.6.2-4] [8.3.2-4]

Provides invariants to the implementation that may be used for optimization purposes.

#pragma omp assumes clause [[[,] clause] ...] #pragma omp begin assumes clause [[[,] clause] ...] declaration-definition-seq #pragma omp end assumes

#pragma omp assume clause [[[,] clause] ...] structured-block

!\$omp assumes clause [[[,] clause] ...]

!\$omp assume clause [[[,] clause] ...] loosely-structured-block !\$omp end assume

!\$omp assume clause [[[,] clause] ...] strictly-structured-block [!\$omp end assume]

clause

absent (directive-name [[, directive-name] ...]) Lists directives absent in the scope.

contains (directive-name [[, directive-name] ...]) Lists directives likely to be in the scope.

holds (omp-logical-expression)

An expression guaranteed to be true in the

no_openmp

Equivalent to union of the **no_openmp_constructs** and no_openmp_routines assumptions.

no_openmp_constructs

Indicates that no OpenMP constructs are encountered in the scope.

no_openmp_routines

Indicates that no OpenMP runtime library calls are executed in the scope.

no_parallelism

Indicates that no OpenMP tasks or SIMD constructs will be executed in the scope.

nothing [10.7] [8.4]

Indicates explicitly that the intent is to have no effect.

#pragma omp nothing [clause] !\$omp nothing [clause]

clause:

apply (applied-directives)

Can be specified only if the nothing directive forms a loop-transforming construct.

error [10.1] [8.5]

Instructs the compiler or runtime to display a message and to perform an error action.

#pragma omp error [clause [[,] clause] ...] !\$omp error [clause [[,] clause] ...]

clause.

at (compilation | execution) message (msg-string) severity (fatal | warning)

Loop-transforming constructs

Merges multiple loops into a single loop that in each iteration executes an iteration of each input loop.

#pragma omp fuse clause loop-nest-sequence !\$omp fuse clause loon-nest-sequence [!\$omp end fuse]

apply (applied-directives) looprange (list of loop nests)

interchange [11.4]

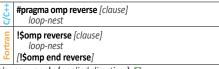

Changes the nesting order of loops in a loop nest.

#pragma omp interchange [clause[[,]clause] ...] !\$omp interchange [clause[[,]clause] ...] loop-nest [!\$omp end interchange] clause

apply (applied-directives) permutation (permutation-list)

reverse [11.5]

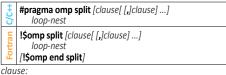

Executes loop iterations in reverse order.

clause: apply (applied-directives)

split [11.6]

Splits a loop into multiple loops that each execute a subset of consecutive iterations.

apply (applied-directives) counts (count-list)

stripe [11.7]

Interleaves execution of loop iterations with respect to the partitions that result from the sizes clause.

#pragma omp stripe [clause[[,]clause] ...] loop-nest !\$omp stripe [clause[[,]clause] ...] loop-nest [!\$omp end stripe] clause.

apply (applied-directives) sizes (size-list)

tile [11.8] [9.1]

Tiles one or more loops.

#pragma omp tile [clause[[,]clause] ...] loop-nest !\$omp tile [clause[[,]clause] ...] loop-nest [!\$omp end tile]

apply (applied-directives) sizes (size-list)

unroll [11.9] [9.2]

Fully or partially unrolls a loop.

c/C++	#pragma omp unroll [clause[[,]clause]] loop-nest
Ιŧ	!\$omp unroll [clause] loop-nest [!\$omp end unroll]
clau	ISP!

apply (applied-directives) partial [(unroll-factor)]

Parallelism constructs

parallel [12.1] [10.1]

Creates a team of OpenMP threads that executes the region.

C/C++	#pragma omp parallel [clause[[,]clause]] structured-block
ur	!\$omp parallel [clause[[,]clause]] loosely-structured-block !\$omp end parallel
Tr.	- or -
윤	!\$omp parallel [clause[[,]clause]] strictly-structured-block
	[!\$omp end parallel]

clause:

allocate 🖪 copyin (list)

default (data-sharing-attribute)

firstprivate (list)

if ([parallel:] omp-logical-expression)

num_threads (nthreads)

Specifies the number of threads to execute.

private (list)

proc_bind (close | primary | spread)

close: Instructs the execution environment to assign the threads in the team to places close to the place of the parent thread.

primary: Instructs the execution environment to assign every thread in the team to the same place as the primary thread.

spread: Creates a sparse distribution for a team of T threads among the P places of the parent's place partition.

reduction [9] safesync (width) severity (fatal | warning) shared (list)

teams [12.2] [10.2]

Creates a league of initial teams where the initial thread of each team executes the region.

++)/)	#pragma omp teams [clause[[,]clause]] structured-block
an	<pre>!\$omp teams [clause[[,]clause]] loosely-structured-block !\$omp end teams</pre>
ortra	- or -
3	<pre>!\$omp teams [clause[[,]clause]] strictly-structured-block /!\$omp end teams]</pre>
_	

clause:

allocate 🖪

default (data-sharing-attribute)

firstprivate (list)

if ([teams:] omp-logical-expression)

num_teams ([lower-bound :] upper-bound) private (list)

reduction 🖪 shared (list)

thread_limit (omp-integer-expression)

simd [12.4] [10.4]

Applied to a loop to indicate that the loop can be transformed into a SIMD loop.

c/c++	#pragma omp simd [clause[[,]clause]] loop-nest
ıt.	!\$omp simd [clause[[,]clause]] loop-nest [!\$omp end simd]

clause.

aligned (list[: alignment])

Declares one or more list items to be aligned to the specified number of bytes.

alignment: Optional constant positive integer expression

collapse (n)

if ([simd:] omp-logical-expression)

induction

linear (list[: linear-step]) nontemporal (list)

Accesses to the storage locations in *list* have low temporal locality across the iterations in which those storage locations are accessed.

order ([order-modifier :] concurrent) G

order-modifier: reproducible or unconstrained

private (list) reduction 🖪 safelen (length)

If used then no two iterations executed concurrently with SIMD instructions can have a greater distance in the logical iteration space than the value of length.

Specifies the preferred number of iterations to be executed concurrently.

masked [12.5] [10.5]

Specifies a structured block that is executed by a subset of the threads of the current team.

#pragma omp masked [clause] structured-block \$omp masked [clause] loosely-structured-block !\$omp end masked - or -!\$omp masked [clause] strictly-structured-block [!\$omp end masked]

clause

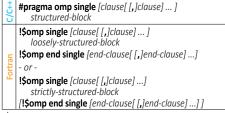

filter (thread num)

Selects which thread executes the structured

Work-distribution constructs

single [13.1] [11.1]

Specifies that the associated structured block is executed by only one of the threads in the team.

clause

allocate 3 copyprivate (list) firstprivate (list) nowait 🖪 private (list)

copyprivate (list) nowait 🖪

SCOPE [13.2] [11.2]

Defines a structured block that is executed by all threads in a team but where additional OpenMP operations can be specified.

```
#pragma omp scope [clause[ [,]clause] ... ]
        structured-block
    !$omp scope [clause[ [,]clause] ... ]
loosely-structured-block
    !$omp end scope [nowait]
    !$omp scope [clause[ [,]clause] ...]

```

clause.

allocate firstprivate (list) lastprivate ([lastprivate-modifier:] list) nowait 🖪 private (list) reduction 🖪

workshare [13.4] [11.4]

Divides execution of the enclosed structured block into separate units of work, each executed only once by one thread in the team.

```
!$omp workshare [clause]
  loosely structured-block
!$omp end workshare [clause]
!$omp workshare [clause]
  strictly structured-block
[!$omp end workshare [clause]]
```

clause

nowait 🖪

workdistribute [13.5]

Divides execution of the enclosed structured block into separate units of work, each executed only once by each initial thread in the league.

```
!$omp workdistribute
      loosely structured-block
    !$omp end distribute
Fortran
    - or
    !$omp workdistribute
      strictly structured-block
    /!$omp end distribute/
```

do and for [13.6.1-2] [11.5.1-2]

Specifies that the iterations of associated loops will be executed in parallel by threads in the team.

C/C++	#pragma omp for [clause[[,]clause]] loop-nest
Fortran	<pre>!\$omp do [clause[[,]clause]] loop-nest [!\$omp end do [nowait]]</pre>

lastprivate ([lastprivate-modifier:] list)

linear (list[: linear-step]) nowait 🖪

order (/ order-modifier : | concurrent)

order-modifier: reproducible or unconstrained

ordered [(n)]

The loops or how many loops to associate with a construct.

private (list) reduction

schedule ([modifier [, modifier] :] kind [, chunk_size])

Values for schedule modifier:

monotonic: Each thread executes its assigned chunks in increasing logical iteration order. Clauses schedule (static) or order imply monotonic.

nonmonotonic: Chunks are assigned to threads in any order. Behavior of an application that depends on execution order of the chunks is unspecified.

simd: Ignored when the loop is not associated with a SIMD construct, else the new chunk size for all chunks except the first and last chunks is [chunk size/simd width] * simd width (simd width: implementation-defined value).

Values for schedule kind:

static: Iterations are divided into chunks of size chunk_size and assigned to team threads in roundrobin fashion in order of thread number.

dynamic: Each thread executes a chunk of iterations then requests another chunk until none remain.

guided: Same as dynamic, except chunk size is different for each chunk, with each successive chunk smaller than the last.

auto: Compiler and/or runtime decides. runtime: Uses run-sched-var ICV.

distribute [13.7] [11.6]

Specifies loops which are executed by the initial teams.

openies to ops which are executed by the miliar teams.		
c/C++	#pragma omp distribute [clause[[,]clause]] loop-nest	
Ę	<pre>!\$omp distribute [clause[[,]clause]] loop-nest [!\$omp end distribute]</pre>	

clause:

```
allocate 3

Directives and Constructs (continued)

loop [13.8] [11.7]

Specifies that the iterations of the associated loops may execute concurrently and permits the encountering thread(s) to execute the loop accordingly.

#pragma omp loop [clause[[,]clause] ...] loop-nest !\$omp loop [clause[[,]clause] ...] loop-nest [!\$omp end loop]

clause

bind (binding)

binding: teams, parallel, or thread.

lastprivate ([lastprivate-modifier :] list) order ([order-modifier :] concurrent)

order-modifier: reproducible or unconstrained

private (list) reduction 🖪

Tasking constructs

task [14.1] [12.5]

Defines an explicit task. The data environment of the task is created according to the data-sharing attribute clauses on the task construct, per-data environment ICVs, and any defaults that apply.

#pragma omp task [clause[[,]clause] ...] structured-block !\$omp task [clause[[,]clause] ...] loosely-structured-block !\$omp end task - or -!\$omp task [clause[[,]clause] ...] strictly-structured-block

[!\$omp end task] clause

affinity ([aff-modifier:] locator-list)

aff-modifier: iterator(iterators-definition)

default (data-sharing-attribute) **depend** ([depend-modifier,] dependence-type:

locator-list)

detach (event-handle)

Task does not complete until given event is fulfilled. (Also see omp_fulfill_event)

event-handle:

c/c++ type omp_event_handle_t For kind omp_event_handle_kind

final (omp-logical-expression)

The generated task will be a final task if the expression evaluates to true.

firstprivate (list)

if ([task :] omp-logical-expression)

mergeable

priority (priority-value)

Hint to the runtime. Sets max priority value.

private (list) replayable 🖪 shared (list) 🖪

threadset (omp_pool | omp_team)

G transparent (impex-type)

impex-type can be omp_import, omp_export, omp_impex, omp_not_impex.

untied

Task is untied: any thread in the binding thread set can resume the task region after suspension.

taskloop [14.2] [12.6]

Specifies that the iterations of one or more affected loops will be executed in parallel using OpenMP tasks.

#pragma omp taskloop [clause[[,]clause] ...] loop-nest !\$omp taskloop [clause[[,]clause] ...] [!\$omp end taskloop]

clause

allocate 3 collapse (n)

CONTINUES IN NEXT COLUMN >

taskloop (continued)

default (data-sharing-attribute)

final (omp-logical-expression)

The generated tasks will be final tasks if the expression evaluates to true.

firstprivate (list)

grainsize ([strict :] grain-size)

Causes number of logical loop iterations assigned to each created task to be ≥ the minimum of the value of the grain-size expression and the number of logical loop iterations, but less than twice the value of the grain-size expression. strict forces use of exact grain size, except for last iteration.

if ([taskloop :] omp-logical-expression) in_reduction (reduction-identifier : list) induction 🖪

lastprivate ([lastprivate-modifier :]list) mergeable

nogroup

Prevents creation of implicit taskgroup region.

num_tasks ([strict :] num-tasks)

Create as many tasks as the minimum of the num-tasks expression and the number of logical loop iterations. **strict** forces exactly *num-tasks* tasks to be created.

priority (priority-value) private (list) reduction replayable 🖪 shared (list) 🖪 threadset untied

> Task is untied: any thread in the binding thread set can resume the task region after suspension.

task iteration [14.2.3]

Controls the per-iteration task-execution attributes of the generated tasks of its associated taskloop construct. Enables the application of task dependences and task affinity to tasks generated by the taskloop construct.

#pragma omp task_iteration clause [[[,]clause] ...] !\$omp task_iteration clause [[[,]clause] ...]

clause:

affinity 🖪 depend

G

if ([task_iteration :] omp-logical-expression)

taskyield [14.12] [12.7]

Specifies that the current task can be suspended in favor of execution of a different task.

#pragma omp taskyield

!\$omp taskyield

taskgraph [14.3]

Executes the structured block and records the sequence and dependences of created tasks for later replaying.

#pragma omp taskgraph [clause[[,]clause] ...] !\$omp taskgraph [clause[[,]clause]...]

graph_id(graph_id)

Numeric identification to distinguish graphs for recording and replay.

graph_reset(omp-logical-condition)

Reset recorded graph with graph-id when condition evaluates to true

if ([taskgraph :] omp-logical-expression) nogroup

Prevents creation of implicit taskgroup region.

Device directives and constructs

target_data [15.7] [13.5]

Maps variables to a device data environment for the extent of the region.

!$omp atomic [clause[ [ [, ] clause] ... ] [, ] ] capture &
      [[,] clause [[[,] clause] ...]]
   capture-statement
   statement
[!$omp end atomic]
```

clause

atomic-clause: read, write, update memory-order-clause: seq_cst, acq_rel, release, acquire, relaxed

extended-atomic: capture, compare, fail, weak

capture: Capture the value of the variable being updated atomically.

compare: Perform the atomic update conditionally.

fail (seq_cst | acquire | relaxed): Specify the memory ordering requirements for any comparison performed by any atomic conditional update that fails. Its argument overrides any other specified memory ordering.

weak: Specify that comparison performed by a conditional atomic update may spuriously fail, evaluating to not equal even when values are equal.

hint (hint-expression)

memscope (device | cgroup | all)

Determines the thread set affected by the atomic operation (device: all threads on the current device; cgroup: all threads in the current contention group; all: all threads in the system).

c/c++ statement:

if atomic clause is	statement:
read	v = x;
write	x = expr;
update	x++; x; ++x;x; x binop = expr; x = x binop expr; x = expr binop x;
compare is present	<pre>cond-expr-stmt: x = expr ordop x ? expr : x; x = x ordop expr ? expr : x; x = x = e ? d : x; cond-update-stmt: if(expr ordop x) { x = expr; } if(x ordop expr) { x = expr; } if(x == e) { x = d; }</pre>
capture is present	<pre>v = expr-stmt { v = x; expr-stmt } { expr-stmt v = x; } (expr-stmt: write-expr-stmt, update-expr-stmt, or cond-expr-stmt.)</pre>
both compare and capture are present	{ $v = x$; $cond$ -update-stmt } { $cond$ -update-stmt $v = x$; } iff($x = e$) { $x = d$; } else { $v = x$; } { $r = x = e$; if(r) { $x = d$; } else { $v = x$; } { $r = x = e$; if(r) { $x = d$; } else { $v = x$; }}

For capture-statement: Has the form v = x

	[!\$omp end ordered]
	- or -
	!\$omp ordered clause[[[,] clause]]
clau	se (for the structured-block forms only):

threads

simd

threads or simd indicate the parallelization level with which to associate a construct.

clause (for the standalone forms only): doacross (dependence-type : [vector])

Identifies cross-iteration dependences that imply additional constraints on the scheduling of loop iterations.

CONTINUES IN NEXT COLUMN >

ordered (continued)

dependence-type:

source

Specifies the satisfaction of cross-iteration dependences that arise from the current iteration. If source is specified, then the vector argument is optional; if vector is omitted, it is assumed to be omp cur iteration. At most one doacross clause can be specified on a directive with source as the dependence-type.

Specifies a cross-iteration dependence, where vector indicates the iteration that satisfies the dependence. If *vector* does not occur in the iteration space, the doacross clause is ignored. If all doacross clauses on an ordered construct are ignored then the construct is ignored.

Cancellation constructs

cancel [18.2] [16.1]

Activates cancellation of the innermost enclosing region of the type specified.

if-clause: if ([cancel :] omp-logical-expression) construct-type-clause:

> c/c++ parallel, sections, taskgroup, for For parallel, sections, taskgroup, do

cancellation_point [18.3] [16.2] ■

Introduces a user-defined cancellation point at which tasks check if cancellation of the innermost enclosing region of the type specified has been activated.

construct-type-clause:

parallel sections taskgroup

C/C++ for

Combined Constructs

The following compound directives are created following the rules defined in Section 19 and Appendix D of the OpenMP API version 6.0 specification. The combined directives shown here are examples of commonly useful compositions of directives and are not a complete list.

distribute parallel do and distribute parallel for

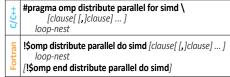

Specify a loop that can be executed in parallel by multiple threads that are members of multiple teams.

ţ)	#pragma omp distribute parallel for [clause] [,]clause] J loop-nest
an	!\$omp distribute parallel do [clause[[,]clause]]
Fort	!\$omp distribute parallel do [clause[[,]clause]] loop-nest [!\$omp end distribute parallel do]

clause: Any clause used for distribute, parallel for, or parallel do.

distribute parallel do simd and distribute parallel for simd [19] [2.11.6.4]

Specifies a loop that can be executed concurrently using SIMD instructions in parallel by multiple threads that are members of multiple teams.

clause: Any clause used for distribute, parallel for simd, or parallel do simd.

distribute simd [19] [2.11.6.2]

Specifies a loop that will be distributed across the primary threads of the teams region and executed concurrently using SIMD instructions.

clause: Any clause used for distribute or simd.

Combined Constructs (continued)

do simd and for simd [19] [2.11.5.2]

Specifies that the iterations of associated loops will be executed in parallel by threads in the team and the iterations executed by each thread can also be executed concurrently using SIMD instructions.

c/c++	#pragma omp for simd [clause[[,]clause]] loop-nest
ŧ	!\$omp do simd [clause[[,]clause]] loop-nest [!\$omp end do simd [nowait]]

clause: Any clause used for simd. for. or do.

masked taskloop [19] [2.16.7]

Shortcut for specifying a **masked** construct containing a taskloop construct and no other statements.

++ O / O	#pragma omp masked taskloop [clause[[,]clause] loop-nest
ŧ	!\$omp masked taskloop [clause[[,]clause]] loop-nest [\$omp end masked taskloop]

clause: Any clause used for taskloop or masked.

masked taskloop simd [19] [2.16.8]

Shortcut for specifying a **masked** construct containing a taskloop simd construct and no other statements.

++2/2	#pragma omp masked taskloop simd \ [clause[[,]clause]] loop-nest
rtran	!\$omp masked taskloop simd [clause[[,]clause]] loop-nest

clause: Any clause used for masked or taskloop simd.

parallel do and parallel for [19] [2.16.1]

🖺 /Śomp end masked taskloop simd/

Specifies a parallel construct containing a worksharingloop construct with a canonical loop nest and no other statements.

c/C++	#pragma omp parallel for [clause[[,]clause]] loop-nest
Fortran	!\$omp parallel do [clause[[,]clause]] loop-nest [!\$omp end parallel do]
-1-	and Annals are and Consequently for a surface and the

clause: Any clause used for parallel, for, or do except the nowait clause.

parallel do simd and parallel for simd [19] [2.16.5]

Shortcut for specifying a parallel construct containing only one worksharing-loop SIMD construct.

++) /)	#pragma omp parallel for simd [clause[[,]clause]] loop-nest
Fortran	!\$omp parallel do simd [clause[[,]clause]] loop-nest !\$omp end parallel do simd

clause: Any clause used for parallel, for simd, or do simd (c/c++ except the **nowait** clause).

parallel loop [19] [2.16.2]

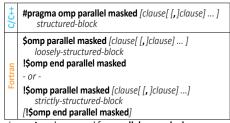

Shortcut for specifying a parallel construct containing a loop construct with a canonical loop nest and no other statements.

+>/>	#pragma omp parallel loop [clause[[,]clause]] loop-nest
Fortran	!\$omp parallel loop [clause[[,]clause]] loop-nest [!\$omp end parallel loop]

clause: Any clause used for parallel or loop.

parallel masked [19] [2.16.6]

Shortcut for specifying a **parallel** construct containing a **masked** construct and no other statements.

clause: Any clause used for parallel or masked.

parallel masked taskloop [19] [2.16.9]

Shortcut for specifying a **parallel** construct containing a **masked taskloop** construct and no other statements.

+5/C	#pragma omp parallel masked taskloop \ [clause[[,]clause]] loop-nest
Fortran	!\$omp parallel masked taskloop [clause[[,]clause]] loop-nest [\$omp end parallel masked taskloop]

clause: Any clause used for parallel or masked taskloop.

parallel masked taskloop simd [19] [2.16.10]

Shortcut to specify a parallel construct containing a masked taskloop simd construct and no other statements.

++2/2	#pragma omp parallel masked taskloop simd \ [clause[[,]clause]] loop-nest
Fortran	!\$omp parallel masked taskloop simd [clause[[,] & clause]] loop-nest [\$omp end parallel masked taskloop simd]

clause: Any clause used for masked taskloop simd or parallel.

parallel target [19]

Specifies a parallel construct that only contains a target construct.

C/C++	#pragma omp parallel target [clause[[,]clause]] structured-block
Fortran	\$omp parallel target [clause[[,]clause]] loosley-structured-block !\$omp end parallel target - or - !\$omp parallel target [clause[[,]clause]] strictly-structured-block [!\$omp end parallel target]

target loop [19] [2.16.15]

Shortcut for specifying a target region containing a loop construct with a canonical loop nest and no other statements.

C/C++	#pragma omp target loop [clause[[,]clause]] loop-nest
Fortran	<pre>!\$omp target loop [clause[[,]clause]] loop-nest [!\$omp end target loop]</pre>

lause: Any clause used for **teams** or **loop**

target teams [19] [2.16.21]

Shortcut for specifying a target construct containing a teams construct and no other statements

++) /)	#pragma omp target teams [clause[[,]clause]] structured-block
Fortran	\$omp target teams [clause[[,]clause]] loosely-structured-block !\$omp end target teams - or - !\$omp target teams [clause[[,]clause]] strictly-structured-block [!\$omp end target teams]

clause: Any clause used for target or teams.

target teams distribute [19] [2.16.22]

Shortcut for specifying a target construct containing a teams distribute construct and no other statements.

t+5/2	#pragma omp target teams distribute [clause[[,] \ clause]] loop-nest
Fortran	\$!\somp target teams distribute [clause[[,]clause]] loop-nest [!\somp end target teams distribute]

clause: Any clause used for target or teams distribute.

target teams distribute simd [19] [2.16.23]

Shortcut for specifying a target construct containing a teams distribute simd construct and no other statements.

C/C++	#pragma omp target teams distribute simd \ [clause[[,]clause]] loop-nest
Fortran	!\$omp target teams distribute simd [clause[[,]clause]] loop-nest [!\$omp end target teams distribute simd]

clause: Any clause used for target or teams distribute simd.

target teams loop [19] [2.16.24]

Shortcut for specifying a target construct containing a teams loop construct and no other statements.

C/C++	#pragma omp target teams loop [clause[[,]clause]] loop-nest
Fortran	!\$omp target teams loop [clause[[,]clause]] loop-nest [!\$omp end target teams loop]

clause: Any clause used for target or teams loop.

target teams distribute parallel do and target teams distribute parallel for

Shortcut for specifying a target construct containing teams distribute parallel for, teams distribute parallel do and no other statements.

	c/C++	#pragma omp target teams distribute parallel for \ [clause[[,]clause]] loop-nest
	Fortran	!\$omp target teams distribute parallel do &
clause.		ICO.

Any clause used for target, teams distribute parallel for, or teams distribute parallel do.

target teams distribute parallel do simd target teams distribute parallel for simd

[19] [2.16.26]

Shortcut for specifying a target construct containing a teams distribute parallel worksharing-loop SIMD construct and no other statements.

C/C+	#pragma omp target teams distribute parallel for simd [clause[[,]clause]] loop-nest
Fortran	!\$omp target teams distribute parallel do simd & [clause[[,]clause]] loop-nest [!\$omp end target teams distribute parallel do simd]

parallel for simd, or teams distribute parallel do simd.

clause: Any clause used for teams or distribute simd.

Notes	
Notes	

Modifier: iterator [5.2.6] [3.2.6]

iterator (iterators-definition)

Identifiers that expand to multiple values in the clause on which they appear.

iterators-definition:

iterator-specifier [, iterators-definition]

iterators-specifier:

[iterator-type] identifier = range-specification

identifier: A base language identifier.

range-specification: begin: end[; step] begin, end: Expressions for which their types

can be converted to iterator-type

step: An integral expression.

iterator-type: c/c++ A type name. For A type specifier. Used in clauses: affinity, depend, from, map, to

Modifier: directive name [5.4]

directive-name-modifier

Each clause can have an optional directive-name-modifier that corresponds to the name of a directive or compound directive that can accept that clause. Examples:

#pragma parallel private(parallel: list)

Specifies that the items in list are private to the parallel region (default for this example).

\$!omp target teams distribute parallel do

if(target:condition1) if(parallel:condition2) Specifies that condition1 applies to the target constituent directive, while condition2 applies to the parallel constituent directive.

Used in clauses: All clauses

affinity clause [14.10] [12.5.1]

affinity (locator-list)

Specifies a hint to indicate data affinity of the generated tasks to the data specified in the locator-list.

Used in: target data, task, task iteration

allocate clause [8.6] [6.6]

allocate ([allocator:] list)

allocate(allocate-modifier [, allocate-modifier]: list)

allocate-modifier:

allocator (allocator)

allocator: is an expression of:

c/C++ type omp_allocator_handle_t

For kind omp_allocator_handle_kind

align (alignment)

alignment: A constant positive integer power of 2.

Used in: allocators, distribute, do and for, parallel, scope, sections, single, target, target_data, task, taskgroup, taskloop, teams

apply clause [11.1]

apply ([loop-modifier:] applied-directives)

After applying a loop-transforming construct, inserts applied-directives in front of the after-transformation loop identified by loop-modifier.

Used in: fuse, interchange, nothing, reverse, split, stripe, tile, unroll

collapse clause [4.4.5] [4.4.3]

collapse (n)

A constant positive integer expression that specifies how many loops are affected by the construct.

Used in: distribute, do and for, loop, simd, taskloop

default clause [7.5.1] [5.4.1]

default (attribute)

Default data-sharing attributes are disabled. All variables in a construct must be declared inside the construct or appear in a data-sharing attribute clause.

attribute: shared, firstprivate, private, none

Used in: parallel, target, target_data, task, taskloop, teams

depend clause [17.9.5] [15.9.5]

Enforces additional constraints on the scheduling of tasks or loop iterations, establishing dependences only between sibling tasks or between loop iterations.

depend ([depend-modifier,]dependence-type: locator-list)

depend-modifier: iterator (iterators-definition)

dependence-type: in, out, inout, mutexinoutset, inoutset, depobj

- in: Generated task will be a dependent task of all previously generated sibling tasks that reference at least one of the list items in an out or inout dependence-type list.
- out and inout: Generated task will be a dependent task of previously generated sibling tasks referencing at least one list item in an in, out, mutexinoutset, inout, or inoutset dependence-type list.
- mutexinoutset: If the storage location of at least one list item is the same as that of a list item in a depend clause with an in, out, inout, or inoutset dependencetype on a construct from which a sibling task was previously generated, then the generated task will be a dependent task of that sibling task. If the storage location of at least one of the list items is the same as that of a list item appearing in a **depend** clause with a mutexinoutset dependence-type on a construct from which a sibling task was previously generated, then the sibling tasks will be mutually exclusive.
- inoutset: If the storage location of at least one list item matches the storage location of a list item in a depend clause with an in, out, inout, or mutexinoutset dependence-type on a construct from which a sibling task was previously generated, then the generated task will be a dependent task of that sibling task.
- depobj: The task dependences are derived from the depend clause specified in the depobj constructs that initialized dependences represented by the depend objects specified in the depend clause as if the depend clauses of the depobj constructs were specified in the current construct.

Used in: dispatch, interop, target, target_enter_data, target_exit_data, target_update, task, task_iteration, taskwait

device clause [15.2] [13.2]

device ([target-device:] device-description)

Identifies the target device that is associated with a device construct

target-device: ancestor, device num

device-description: An expression of type integer that refers to the device number or, if ancestor modifier is specified, must be 1.

Used in: dispatch, interop, target, target_data, target_enter_data, target_exit_data, target_update

firstprivate clause [7.5.4] [5.4.4]

firstprivate (list)

Declares list items to be private to each thread or explicit task and assigns them the value the original variable has at the time the construct is encountered.

Used in: distribute, do and for, parallel, scope, sections, single, target, target_data, task, taskloop, teams

if clause [5.5] [3.4]

if ([directive-name-modifier:] omp-logical-expression)

The effect of the if clause depends on the construct to which it is applied. For compound constructs, it only applies to the semantics of the construct named in the directive-name-modifier if one is specified. If no modifier is specified for a compound construct then the if clause applies to all constructs to which an if clause can apply.

Used in: cancel, parallel, sim, target, target_data, target_enter_data, target_exit_data, target_update, task, task_iteration, taskgraph, taskloop, teams

induction clause [7.6.13]

induction (induction-identifier [, induction-modifier] [, step-modifier]: list)

Computes the closed form of an expression for the iterations of a loop.

induction-identifier: Either an id-expression or one of the following operators: +, *

induction-modifier: strict, relaxed

strict: Compute the induction value for each iteration and assign to the original item in list.

relaxed: Implementation may assume that the value of the closed form is computed at the end without assigning to the original item in list in each iteration.

step-modifier: step(induction-step)

The increment to be applied for each iteration when computing the closed form.

Used in: distribute, do and for, simd, taskloop

in_reduction clause [7.6.12] [6.5.11]

in reduction (reduction-identifier: list)

Defines a task to be a participant in a task reduction that is defined by an enclosing region for a matching list item that appears in a task_reduction clause or a reduction clause with task as the reduction-modifier.

C++ reduction-identifier:

Either an id-expression or one of the following operators: +, *, &, |, ^, &&, ||

c reduction-identifier:

Either an *identifier* or one of the following operators:

+, *, &, |, ^, &&, ||

For reduction-identifier:

Either a base language identifier, a user-defined operator, one of the following operators:

+, *, .and., .or., .eqv., .neqv.,

or one of the following intrinsic procedure names: max. min. jand. jor. jeor.

Used in: target, target_data, task, taskloop

lastprivate clause [7.5.5] [5.4.5]

lastprivate ([lastprivate-modifier:] list)

List items must be loop iteration variables of the affected loops. Same effect as the private clause, and after leaving the region, also assigns the values that each variable had at the end of the last iteration of a loop back to the original variable.

lastprivate-modifier: conditional

conditional: Preserves the previous value if a variable is not assigned a new value in the last iteration of the

Used in: distribute, do and for, loop, sections, simd, taskloop

linear clause [7.5.6] [5.4.6]

linear (linear-list[: linear-step]) linear (linear-list [: linear-modifier [, linear-modifier]])

Declares each *linear-list* item to have a value or address affine with respect to the iteration number.

linear-list: list (or for declare simd argument-list)

linear-modifier: step(linear-step), linear-type-modifier

linear-step: OpenMP integer expression (1 is default) linear-type-modifier: val, ref, uval (val is default)

val: The value is linear

(C++ and Fortran only)

ref: The address is linear (C++ and Fortran only)

uval: The value is linear, may not be modified

The **ref** and **uval** modifiers may only be specified for a linear clause on the declare simd directive, and only for arguments that are passed by reference.

Used in: declare simd, do and for, simd

C/C++: C /C++ content | For: Fortran content | [n.n.n]: 6.0. spec | [n.n.n]: 5.2. spec | ๔: Clause info pg. 10 | ☎: Underscore optional **OpenMP API 6.0**

Clauses (continued)

map clause [7.9.6] [5.8.3]

map ([[map-modifier, [map-modifier, ...] map-type:] locator-list)

Maps data from the task's environment to the device environment.

map-type: alloc, to, from, tofrom, release, delete For the target or target data directives: map-type: alloc, to, from, tofrom, release For the target enter data directive: map-type: alloc, to, from, tofrom For the target exit data directive: map-type: to, from, tofrom, release, delete

map-modifier: always, close, present, mapper(mapper-id), iterator(iterators-definition)

Used in: declare_mapper, target, target_data, target_enter_data, target_exit_data

nowait clause [17.6] [15.6]

nowait ([value])

value: true. false

If no argument is specified, it will default to true. Overrides any synchronization that would otherwise occur at the end of a construct. It can also specify that an interoperability requirement set includes the nowait property. If the construct includes an implicit barrier, the nowait clause specifies that the barrier will not occur.

Used in: dispatch, do and for, interop, scope, sections, single, target, target_data, target_enter_data, target_exit_data, target_update, taskwait, workshare

order clause [12.3] [10.3]

order ([order-modifier :] concurrent)

order-modifier: reproducible, unconstrained Specifies an expected order of execution for the iterations of the associated loops of a loop-associated directive

Used in: distribute, do and for, loop, simd

priority clause [14.9] [12.4]

priority (priority-value)

Specifies, in the priority-value argument, a task priority for the construct on which it appears.

Used in: target, target_data, target_enter_data, target_exit_data, target update, task, taskgraph, taskloop

private clause [7.5.3] [5.4.3]

Creates a new variable for each item in list that is private to each thread or explicit task. The private variable is not given an initial value.

Used in: distribute, do and for, loop, parallel, scope, sections, simd, single, target, target_data, task, taskloop, teams

reduction clause [7.6.10] [5.5.8]

reduction ([reduction-modifier ,] reduction-identifier : list) Combines the values a variable has in each task or SIMD lane into a single value.

reduction-modifier: inscan, task, default

C++ reduction-identifier:

Either an id-expression or one of the following operators: +, *, &, |, ^, &&, ||

c reduction-identifier:

Either an identifier or one of the following operators: +, *, &, |, ^, &&, ||

For reduction-identifier:

Either a base language identifier, a user-defined operator, one of the following operators:

+, *, .and., .or., .eqv., .neqv.,

or one of the following intrinsic procedure names: max, min, iand, ior, ieor.

Used in: do and for, loop, parallel, scope, sections, simd, taskloop, teams

replayable clause [14.6]

replayable

Marks the generated task for recording and replay for the taskgraph construct.

Page 11

Used in: target, target_enter_data, target_exit_data, target update, task, taskloop, taskwait

shared clause [7.5.2] [5.4.2]

shared (list)

Variables in list are shared between threads or explicit tasks executing the construct.

Used in: parallel, target_data, task, taskloop, teams

task reduction clause [7.6.11, 7.6.7] [5.5.9]

task reduction (reduction-identifier : list)

A reduction-scoping clause that defines the region in which a reduction is computed by tasks or SIMD lanes via the in reduction clause.

See reduction clause for details about reduction-identifier.

Used in: taskgroup

threadset clause [14.8]

threadset (set)

Specifies the set of threads that may execute tasks that are generated by the construct on which it appears. If the encountering task is a final task, the threadset clause is

set: omp_team, omp_pool

Used in: task, taskloop

Runtime Library Routines

Parallel region support routines

omp set num threads [21.1] [18.2.1] Affects the number of threads used for subsequent

parallel constructs not specifying a num_threads clause, by setting the value of the first element of the nthreads-var ICV of the current task to num threads.

void omp_set_num_threads (int num_threads);

subroutine omp_set_num_threads (num_threads) integer num_threads

omp get num threads [21.2] [18.2.2]

Returns the number of threads in the current team. The binding region for an **omp_get_num_threads** region is the innermost enclosing **parallel** region. If called from the sequential part of a program, this routine returns 1.

int omp_get_num_threads (void); integer function omp_get_num_threads ()

omp_get_thread_num [21.3] [18.2.4]

Returns the thread number of the calling thread within the current team, ranging from 0 to one less than the total number of threads.

int omp_get_thread_num (void); integer function omp_get_thread_num ()

omp get max threads [21.4] [18.2.3]

Returns an upper bound on the number of threads that could be used to form a new team if a parallel construct without a num threads clause were encountered after execution returns from this routine.

int omp_get_max_threads (void);

integer function omp_get_max_threads ()

omp_get_thread_limit [21.5] [18.2.13]

Returns the maximum number of OpenMP threads available in contention group. ICV: thread-limit-var

int omp_get_thread_limit (void);

integer function omp_get_thread_limit ()

omp_in_parallel [21.6] [18.2.5]

Returns true if the active-levels-var ICV is greater than zero, meaning the current task is enclosed by an active parallel region; otherwise it returns false.

int omp_in_parallel (void);

logical function omp_in_parallel ()

omp set dynamic [21.7] [18.2.6]

Enables or disables dynamic adjustment of the number of threads available for the execution of subsequent parallel regions by setting the value of the dyn-var ICV.

void omp_set_dynamic (int dynamic_threads);

subroutine omp_set_dynamic (dynamic_threads) logical dynamic_threads

omp_get_dynamic [21.8] [18.2.7]

Returns the value of dyn-var ICV. True means dynamic adjustment of the number of threads is enabled for the current task. Use + or | (C/C++) or + (For) to combine kinds with the modifier omp_sched_monotonic (see [20.5.1][18.2.11]).

int omp_get_dynamic (void);

logical function omp_get_dynamic ()

OpenMP API 6.0 C/C++: C/C++ content | For: Fortran content | [n.n.n]: 6.0. spec | [n.n.n]: 5.2. spec | [a: Clause info pg. 10 | [a: Underscore optional

Runtime Library Routines (continued)

omp_set_schedule [21.9] [18.2.11]

integer chunk_size

Affects the schedule applied when **runtime** is used as schedule kind, by setting the value of the *run-sched-var* ICV.

C/C+	<pre>void omp_set_schedule(omp_sched_t kind, int chunk_size);</pre>
rtran	subroutine omp_set_schedule (kind, chunk_size) integer (omp_sched_kind) kind

kind for omp_set_schedule and omp_get_schedule is an implementation-defined schedule or:

omp_sched_static omp_sched_dynamic omp_sched_guided omp_sched_auto

Use + or | operators (C/C++) or the + operator (For) to combine the kinds with the modifier omp_sched_monotonic.

omp_get_schedule [21.10] [18.2.12]

Returns the schedule applied when **runtime** schedule is used. ICV: *run-sched-var*

c/C++	<pre>void omp_get_schedule (omp_sched_t *kind, int *chunk_size);</pre>
Fortran	subroutine omp_get_schedule (kind, chunk_size) integer (omp_sched_kind) kind integer chunk_size

See omp set schedule for kind.

omp_get_supported_active_levels [21.11] [18.2.14]

Returns the number of active levels of parallelism supported.

c/C+	<pre>int omp_get_supported_active_levels (void);</pre>	
For	integer function omp_get_supported_active_levels ()	1

omp_set_max_active_levels [21.12] [18.2.15]

Limits the number of nested active parallel regions when a new nested parallel region is generated by the current task, by setting max-active-levels-var ICV.

+⊃/)	void omp_set_max_active_levels (int max_levels);
For	subroutine omp_set_max_active_levels (max_levels) integer max_levels

omp_get_max_active_levels [21.13] [18.2.16]

Returns the maximum number of nested active parallel regions when the innermost parallel region is generated by the current task. ICV: max-active-levels-var

C/C+	<pre>int omp_get_max_active_levels (void);</pre>
For	integer function omp_get_max_active_levels ()

omp_get_level [21.14] [18.2.17]

Returns the number of nested parallel regions on the device that enclose the task containing the call. ICV: *levels-var*

++) /)	int omp_get_level (void);
For	integer function omp_get_level ()

omp_get_ancestor_thread_num [21.15] [18.2.18]

Returns, for a given nested level of the current thread, the thread number of the ancestor of the current thread.

c/c+	<pre>int omp_get_ancestor_thread_num (int level);</pre>
Fortran	integer function omp_get_ancestor_thread_num (level integer level

omp_get_team_size [21.16] [18.2.19]

Returns, for a given nested level of the current thread, the size of the thread team to which the ancestor or the current thread belongs.

t+2/2	int omp_get_team_size (int /eve/);
For	integer function omp_get_team_size (level) integer level

omp_get_active_level [21.17] [18.2.20]

Returns the number of active, nested parallel regions on the device enclosing the task containing the call. ICV: active-level-var

±2/2	int omp_get_active_level (void);
For	integer function omp_get_active_level ()

Teams region routines

omp_get_num_teams [22.1] [18.4.1]

Returns the number of initial teams in the current **teams** region.

c/C++	int omp_get_num_teams (void);
For	integer function omp_get_num_teams ()

omp_set_num_teams [22.2] [18.4.3]

Sets the value of the *nteams-var* ICV of the current device, affecting the number of teams to be used for subsequent **teams** regions that do not specify a **num_teams** clause.

¢/	void omp_set_num_teams (int num_teams);
or	subroutine omp_set_num_teams(num_teams) integer num_teams
1	integer num teams

omp_get_team_num [22.3] [18.4.2]

Returns the value of the *team-num-var* ICV, which is the team number of the current team and is an integer between 0 and one less than the number of teams in the currents teams region.

c/c	int omp_get_team_num (void);
For	integer function omp_get_team_num ()

omp_get_max_teams [22.4] [18.4.4]

Returns an upper bound on the number of teams that could be created by a **teams** construct without a **num_teams** clause that is encountered after execution returns from this routine. ICV: nteams-var

C/C++	int omp_get_max_teams (void);
For	integer function omp_get_max_teams()

omp_get_teams_thread_limit [22.5] [18.4.6]

Returns the maximum number of OpenMP threads available to participate in each contention group created by a **teams** construct.

C/C+	int omp_get_teams_thread_limit (void);
For	<pre>int omp_get_teams_thread_limit (void); integer function omp_get_teams_thread_limit ()</pre>

omp_set_teams_thread_limit [22.6] [18.4.5]

Sets the maximum number of OpenMP threads that can participate in each contention group created by a **teams** construct by setting the value of *teams-thread-limit-var* ICV.

c/C++	<pre>void omp_set_teams_thread_limit(int thread_limit);</pre>
Fortran	subroutine omp_set_teams_thread_limit & (thread_limit) integer thread_limit

Tasking support routines

omp_get_max_task_priority [23.1.1] [18.5.1]

Returns the maximum value that can be specified in the $\mbox{{\bf priority}}$ clause.

Page 12

c/C++	int omp_get_max_task_priority (void);
For	integer function omp_get_max_task_priority ()

omp_in_explicit_task [23.1.2]

Returns true if the encountering task is an explicit task region.

_	
+- 2/ 2	int omp_in_explicit_task (void);
For	logical function omp_in_explicit_task ()

omp_in_final [23.1.3] [18.5.3]

Returns true if the routine is executed in a final task region; otherwise, it returns false.

++) /	int omp_in_final (void);
For	logical function omp_in_final ()

omp_is_free_agent [23.1.4]

Returns true if a free-agent thread is executing the enclosing task region at the time the routine is called.

c/C++	int omp_is_free_agent (void);
For	logical function omp_is_free_agent ()

omp_ancestor_is_free_agent [23.1.5]

Returns true if the ancestor thread of the encountering thread is a free-agent thread.

	<pre>int omp_ancestor_is_free_agent (int level);</pre>
For	logical function omp_ancestor_is_free_agent (level) integer level

Event routine

Event routines support OpenMP event objects, which must be accessed through the routines described in this section or through the **detach** clause.

omp_fulfill_event [23.2.1] [18.11.1]

Fulfills and destroys the event associated with the *event* argument.

	<pre>void omp_fulfill_event (omp_event_handle_t event);</pre>
For	subroutine omp_fulfill_event (event) integer (omp_event_handle_kind) event

Device information routines

omp_set_default_device [24.1] [18.7.2]

Assigns the value of the *default-device-var* ICV, which determines default target device.

C/C++	<pre>void omp_set_default_device (int device_num);</pre>
For	subroutine omp_set_default_device (device_num) integer device_num

omp_get_default_device [24.2] [18.7.3]

Returns the value of the *default-device-var* ICV, which is the device number of the default target device.

c/C++	int omp_get_default_device (void);
For	integer function omp_get_default_device ()

OpenMP API 6.0 C/C++: C/C++ content | For: Fortran content | [n.n.n]: 6.0. spec | [n.n.n]: 5.2. spec | G: Clause info pg. 10 | G: Underscore optional

Runtime Library Routines (continued)

omp_get_num_devices [24.3] [18.7.4]

Returns the number of non-host devices available for offloading code or data.

c/C++	int omp_get_num_devices (void);
For	integer function omp_get_num_devices ()

omp_get_device_num [24.4] [18.7.5]

Returns the device number of the device on which the calling thread is executing.

c/C++	int omp_get_device_num (void);
For	integer function omp_get_device_num ()

omp_get_num_procs [24.5] [18.7.1]

Returns the number of processors that are available to the device at the time the routine is called.

++>/>	int omp_get_num_procs (void);
For	integer function omp_get_num_procs ()

omp_get_max_progress_width [24.6]

Returns the maximum size, in terms of hardware threads, of progress units on the device specified by device_num.

t)/c	<pre>int omp_get_max_progress_width (int device_num);</pre>
rtran	integer function omp_get_max_progress_width & (device_num)
2	integer device_num

omp_get_device_from_uid [24.7]

Returns the device number that is associated with the unique string in *uid*, or **omp_invalid_device** if the device does not exist.

C/C++	<pre>int omp_get_device_from_uid (const char *uid);</pre>
For	integer function omp_get_device_from_uid (uid) character (len=*), intent(in) :: uid

omp_get_uid_from_device [24.8]

Returns the unique string that identifies the device device_num, or NULL if device_num has the value omp_invalid_device

C/C++	<pre>const char *omp_get_uid_from_device (int device_num);</pre>
Fortran	character(:) function omp_get_uid_from_device & (device_num) pointer :: omp_get_uid_from_device integer, intent(in) :: device_num

omp is initial device [24.9] [18.7.6]

Returns true if the current task is executing on the host device; otherwise, it returns false.

++)/)	int omp_is_initial_device (void);
For	logical function omp_is_initial_device ()

omp_get_initial_device [24.10] [18.7.7]

Returns the device number of the host device

neturns the device number of the nost device.		
t+2/2	int omp_get_initial_device (void);	
For	integer function omp_get_initial_device()	

omp_get_device_num_teams [24.11]

Returns the number of teams that will be requested for a teams region on device *device_num* if the **num_teams** clause is not specified.

C/C++	<pre>int omp_get_device_num_teams (int device_num);</pre>
Fortran	integer function omp_get_device_num_teams & (device_num) integer device_num

omp_set_device_num_teams [24.12]

Sets the number of teams that will be requested for a teams region on device *device_num* if the **num_teams** clause is not specified.

C/C++	<pre>void omp_set_device_num_teams (int num_teams, int device_num);</pre>
Fortran	subroutine omp_set_device_num_teams & (num_teams, device_num) integer num_teams, device_num

omp_get_device_teams_thread_limit [24.13]

Returns max number of threads available to execute tasks in each contention group that a **teams** construct creates.

# J/ 0	<pre>int omp_get_device_teams_thread_limit (int device_num);</pre>
rtran	integer function omp_get_device_teams_thread_limit & (device_num)
6	integer device num

omp_set_device_teams_thread_limit [24.14]

Defines max number of threads available to execute tasks in each contention group that a **teams** construct creates.

t waid amy ast davisa tasms thread limit

c/C+	int thread_limit, int device_num);
Fortran	subroutine function omp_set_device_teams_ & thread_limit (thread_limit, device_num) integer thread_limit, device_num

Device memory routines

These routines support allocation and management of pointers in the data environments of target devices.

omp_target_is_present [25.2.1] [18.8.3]

Tests whether a host pointer refers to storage that is mapped to a given device.

C/C++	<pre>int omp_target_is_present (const void *ptr, int device_num);</pre>
Fortran	integer(c_int) function omp_target_is_present(& ptr, device_num) bind(c) use, intrinsic:: iso_c_binding, only: c_ptr, c_int type(c_ptr), value, intent(in):: ptr integer(c_int), value:: device_num

omp_target_is_accessible [25.2.2] [18.8.4]

Tests whether specific *ptr* of memory address and size is accessible from a given device.

C/C++	<pre>int omp_target_is_accessible (const void *ptr, size_t size, int device_num);</pre>
Fortran	integer(c_int) function omp_target_is_accessible(& ptr, size, device_num) bind(c) use, intrinsic :: iso_c_binding, only : & c_int, c_ptr, c_size_t type(c_ptr), value, intent(in) :: ptr integer(c_size_t), value :: size integer(c_int), value :: device_num

www.openmp.org

omp_get_mapped_ptr [25.2.3] [18.8.11]

Returns the device pointer that is associated with a host pointer for a given device.

Page 13

++ 3/ 3	<pre>void *omp_get_mapped_ptr (const void *ptr, int device_num);</pre>
Fortran	<pre>type(c_ptr) function omp_get_mapped_ptr(& ptr, device_num) bind(c) use, intrinsic :: iso_c_binding, only : c_ptr, c_int type(c_ptr), value, intent(in) :: ptr integer(c_int), value :: device_num</pre>

omp_target_alloc [25.3] [18.8.1]

Allocates memory in a device data environment and returns a device pointer to that memory.

c/C++	<pre>void *omp_target_alloc (size_t size, int device_num);</pre>
Fortran	type(c_ptr) function omp_target_alloc(& size, device_num) bind(c) use, intrinsic :: iso_c_binding, only : c_ptr, & c_size_t, c_int integer(c_size_t), value :: size integer(c_int), value :: device_num

omp_target_free [25.4] [18.8.2]

Frees the device memory allocated by the **omp_target_alloc** routine.

C/C++	<pre>void omp_target_free (void *device_ptr, int device_num);</pre>
Fortran	subroutine omp_target_free(device_ptr, device_num) & bind(c) use, intrinsic :: iso_c_binding, only : c_ptr, c_int type(c_ptr), value :: device_ptr integer(c_int), value :: device_num

omp_target_associate_ptr [25.5] [18.8.9]

Maps a device pointer, which may be returned from omp_target_alloc or implementation-defined runtime routines, to a host pointer.

int omp_target_associate_ptr (const void *host_ptr,

·)/)	<pre>const void *device_ptr, size_t size, size_t device_offset, int device_num);</pre>
Fortran	integer(c_int) function omp_target_associate_ptr(& host_ptr, device_ptr, size, device_offset, & device_num) bind(c) use, intrinsic :: iso_c_binding, only : & c_int, c_ptr, c_size_t type(c_ptr), value, intent(in) :: host_ptr, device_ptr integer(c_size_t), value :: size, device_offset integer(c_int), value :: device_num

omp_target_disassociate_ptr [25.6] [18.8.10]

Removes the associated device data on device *device_num* from the presence table for host printer *ptr*.

t+2/2	<pre>int omp_target_disassociate_ptr (const void *ptr, int device_num);</pre>
Fortran	integer(c_int) function omp_target_disassociate_ptr & (ptr, device_num) bind(c) use, intrinsic :: iso_c_binding, only : c_ptr, c_int type(c_ptr), value, intent(in) :: ptr integer(c_int), value :: device_num

Runtime Library Routines (continued)

omp_target_memcpy [25.7.1] [18.8.5]

Copies memory between any combination of host and device pointers.

int omp_target_memcpy (void *dst, const void *src, size_t length, size_t dst_offset, size_t src_offset, int dst_device_num, int src_device_num);

integer(c_int) function omp_target_memcpy(& dst, src, length, dst_offset, src_offset, & dst_device_num, src_device_num) bind(c) use, intrinsic :: iso_c_binding, only : &

c_int, c_ptr, c_size_t type(c_ptr), value :: dst

Memory space routines

omp_get_devices_memspace [27.1.1]

This is a memory-space-retrieving routine for the devices specified in the *devs* argument.

t+2/2	omp_memspace_handle_t omp_get_devices_memspace (int ndevs, const int *devs, omp_memspace_handle_t memspace);
Fortran	integer (omp_memspace_handle_kind) & function omp_get_devices_memspace & (ndevs, devs, memspace) integer, intent (in):: ndevs, devs (*) integer (omp_memspace_handle_kind), & intent (in):: memspace

omp_get_device_memspace [27.1.2]

The device selected is the device specified in the *dev* argument.

++2/2	<pre>omp _memspace_handle_t omp_get_device_memspace (int dev, omp _memspace_handle_t memspace);</pre>
Fortran	integer (omp_memspace_handle_kind) & function omp_get_device_memspace & (dev, memspace)
ō	integer, intent (in) :: dev
ш.	integer (omp_memspace_handle_kind), &
	intent (in) :: memspace

omp_get_devices_and_host_memspace [27.1.3]

This is a memory-space-retrieving routine for the host device and devices specified by the *devs* argument.

++2/2	omp_memspace_handle_t omp_get_devices_and_host_memspace (int ndevs, const int *devs, omp_memspace_handle_t memspace);
Fortran	integer (omp_memspace_handle_kind) & function omp_get_devices_and_host_memspace & (ndevs, devs, memspace) integer, intent (in) :: ndevs, devs (*) integer (omp_memspace_handle_kind), & intent (in) :: memspace

omp_get_device_and_host_memspace

[27.1.4]

This is a memory-space-retrieving routine for the host device and device specified by the *dev* argument.

C/C++	<pre>omp_memspace_handle_t omp_get_device_and_host_memspace (int dev, omp _memspace_handle_t memspace);</pre>
Fortran	integer (omp_memspace_handle_kind) & function omp_get_device_and_host_memspace & (dev, memspace)
	<pre>integer, intent (in) :: dev integer (omp_memspace_handle_kind), & intent (in) :: memspace</pre>

omp_get_devices_all_memspace [27.1.5]

This is a memory-space-retrieving routine that selects all available devices.

c/C++	<pre>omp _memspace_handle_t omp _get_devices_all_memspace (omp _memspace_handle_t memspace);</pre>
Fortran	integer (omp_memspace_handle_kind) & function omp_get_devices_all_memspace & (memspace) integer (omp_memspace_handle_kind), & intent (in) :: memspace

Memory management routines

omp_get_memspace_num_resources [27.2]

Returns the number of distinct storage resources associated with the memory space represented by *memspace*.

C/C++	<pre>int omp_get_memspace_num_resources (omp_memspace_handle_t memspace);</pre>
ran	integer function omp_get_memspace_num_resources & (memspace)
Fort	integer (omp_memspace_handle_kind), & intent (in) :: memspace

omp_get_memspace_pagesize [27.3]

Returns the page size that the memory space represented by the *memspace* handle supports.

₹ C/C	<pre>omp_intptr_t omp_get_memspace_pagesize (omp_memspace_handle_t memspace);</pre>	
Fortran	integer (c_size_t) function & omp_get_memspace_pagesize (memspace) bind(c) use, intrinsic :: iso_c_binding, only : c_size_t integer (omp_memspace_handle_kind), & intent (in) :: memspace	

omp_get_submemspace [27.4]

Returns a new memory space that contains a subset of the resources of the original memory space.

C/C++	<pre>omp_memspace_handle_t omp_get_submemspace (omp_memspace_handle_t memspace, int num_resources, const int *resources);</pre>
Fortran	integer (omp_memspace_handle_kind) function & omp_get_submemspace (memspace, & num_resources, resources)
	<pre>integer (omp_memspace_handle_kind), & intent (in) :: memspace integer, intent (in) :: num_resources, resources (*)</pre>

omp_init_allocator [27.6] [18.13.2]

Initializes allocator and associates it with a memory space.

c/C++	<pre>omp_allocator_handle_t omp_init_allocator (omp_memspace_handle_t memspace, int ntraits, const omp_alloctrait_t *traits);</pre>
Fortran	integer (omp_allocator_handle_kind) function & omp_init_allocator (memspace, ntraits, traits integer (omp_memspace_handle_kind), & intent (in) :: memspace integer, intent (in) :: ntraits type (omp_alloctrait), intent (in) :: traits (*)

omp_destroy_allocator [27.7] [18.13.3]

Releases all resources used by the allocator handle.

c/c++	<pre>void omp_destroy_allocator (omp_allocator_handle_t allocator);</pre>
Fortran	subroutine omp_destroy_allocator (allocator) integer (omp_allocator_handle_kind), & intent (in) :: allocator

omp_set_default_allocator [27.9] [18.13.4]

Sets the default memory allocator to be used by allocation calls, **allocate** directives, and **allocate** clauses that do not specify an allocator.

Page 15

++) /)	void omp_set_default_allocator (omp_allocator_handle_t allocator);
Fortran	subroutine omp_set_default_allocator (allocator) integer (omp_allocator_handle_kind), & intent (in) :: allocator

omp_get_default_allocator [27.10] [18.13.5]

Returns the memory allocator to be used by allocation calls, allocate directives, and allocate clauses that do not specify an allocator.

++0/0	omp_allocator_handle_t omp_get_default_allocator (void);
For	integer (omp_allocator_handle_kind) & function omp_get_default_allocator ()

Memory partitioning routines

omp_init_mempartitioner [27.5.1]

Initializes the memory partitioner that the *partitioner* object represents, with a lifetime (*lifetime*), computation procedure (*compute_proc*), and a release procedure (*release_proc*).

C/C++	void omp_init_mempartitioner (omp_mempartitioner_t *partitioner, omp_mempartitioner_lifetime_t lifetime, omp_mempartitioner_compute_proc_t compute_proc, omp_mempartitioner_release_proc_t release_proc);
Fortran	subroutine omp_init_mempartitioner (& partitioner, lifetime, compute_proc, release_proc integer (omp_mempartitioner_kind), & intent(out) :: partitioner integer (omp_mempartitioner_lifetime_kind) & intent(in) :: lifetime procedure (omp_mempartitioner_compute_proc_t) & compute_proc procedure (omp_mempartitioner_release_proc_t) & release_proc

omp_destroy_mempartitioner [27.5.2]

Uninitializes a memory partitioner, unitializing the state of the memory partitioner and releasing resources.

C/C++	void omp_destroy_mempartitioner (const omp_mempartitioner_t *partitioner);
For	subroutine omp_destroy_mempartitioner (partitioner) integer (omp_mempartitioner_kind), & intent(in) :: partitioner

omp_init_mempartition [27.5.3]

Initializes a memory partition object *partition* with *nparts* parts and associates the *user_data* argument with it.

t+2/2	<pre>void omp_init_mempartition (omp_mempartition_t *partition), size_t nparts, const void *user_data);</pre>
Fortran	subroutine omp_init_mempartition (partition, nparts,& user_data) bind(c) use, intrinsic :: iso_c_binding, only : c_ptr, c_size_t integer (omp_mempartition_kind), &

omp_destroy_mempartition [27.5.4]

Uninitializes a memory partition object *partition*, releasing the memory partition and its resources.

C/C++	void omp_destroy_mempartition (const omp_mempartition_t *partition);	
For	subroutine omp_destroy_mempartition (partition integer (omp_mempartition_kind), & intent(in) :: partition	Con

OpenMP API 6.0 C/C++: C /C++ content | For: Fortran content | [n.n.n]: 6.0. spec | [n.n.n]: 5.2. spec | ☐: Clause info pg. 10 | ☐: Underscore optional

Runtime Library Routines (continued)

omp_mempartition_set_part [27.5.5]

Defines the size and resource of a given part of a memory

int omp_mempartition_set_part (omp_mempartition_t *partition, size_t *part, int resource, size_t size);

integer function omp_mempartition_set_part & (partition, part, resource, size) bind(c) use, intrinsic :: iso_c_binding, only : c_size_t integer (omp_mempartition_kind), & intent(out) :: partition

integer (c_size_t), intent(in) :: part, size integer, intent(in) :: resource

omp_mempartition_get_user_data [27.5.6]

Retrieves and returns the user data that was associated with the memory partition when it was created.

void *omp_mempartition_get_user_data (const omp mempartition t *partition); type (c_ptr) function & omp_mempartition_get_user_data (partition) & bind(c) use, intrinsic :: iso_c_binding, only : c_ptr integer (omp mempartition kind), & intent(in) :: partition

Memory allocator retrieving routines

omp_get_devices_allocator [27.8.1]

A memory-allocator-retrieving routine for the devices specified in the devs argument.

omp_allocator_handle_t omp_get_devices_allocator
(int ndevs, const int *devs, omp_memspace_handle_t memspace); integer (omp_allocator_handle_kind) function & omp_get_devices_allocator (ndevs, devs, memspace integer, intent(in) :: ndevs, devs (*) integer (omp_memspace_handle_kind), &

omp_get_device_allocator [27.8.2]

intent(in) :: memspace

Get a memory allocator for the device dev.

omp_allocator_handle_t omp_get_device_allocator (int dev, omp_memspace_handle_t memspace); integer (omp_allocator_handle_kind) function & omp_get_device_allocator (dev, memspace

integer, intent(in) :: dev integer (omp_memspace_handle_kind), & intent(in) :: memspace

omp_get_devices_and_host_allocator [27.8.3]

Get a memory allocator for the host device and the devices specified in devs.

omp_allocator_handle_t $omp_get_devices_and_host_allocator \ ($ int ndevs, const int *devs, omp_memspace_handle_t memspace); integer (omp_allocator_handle_kind) function & omp_get_devices_and_host_allocator & (ndevs, devs, memspace) integer, intent(in) :: ndevs, devs (*) integer (omp_memspace_handle_kind), &
 intent(in) :: memspace

omp_get_device_and_host_allocator [27.8.4] Get a memory allocator for the host device and the

device dev.

omp_allocator_handle_t omp_get_device_and_host_allocator (int dev, omp memspace handle t memspace); integer (omp_allocator_handle_kind) function & omp_get_device_and_host_allocator & (dev. memspace) integer, intent(in) :: dev integer (omp_memspace_handle_kind), &
 intent(in) :: memspace

omp_get_devices_all_allocator [27.8.5]

Get a memory allocator for all available devices.

omp_allocator_handle_t omp_get_devices_all_allocator (omp_memspace_handle_t memspace); integer (omp_allocator_handle_kind) function & omp_get_devices_all_allocator (memspace integer (omp_memspace_handle_kind), & intent(in) :: memspace

Memory allocating routines

omp_alloc and omp_aligned_alloc [27.11.1-2] [18.13.6] Request a memory allocation from a memory allocator.

void *omp_alloc (size_t size, omp_allocator_handle_t allocator); void *omp_aligned_alloc (size_t alignment, size_t size, omp_allocator_handle_t omp_null_allocator); void *omp_alloc (size_t size, omp_allocator_handle_t allocator = omp null allocator); void *omp_aligned_alloc (size_t size, size_t alignment, ${\bf omp_allocator_handle_t} \ \overline{allocator}$ = omp_null_allocator); type(c_ptr) function omp_alloc (size, allocator) bind(c) use, intrinsic :: iso_c_binding, only : c_ptr, c_size_t integer(c_size_t), value :: size integer(omp_allocator_handle_kind), value :: allocator type(c_ptr) function omp_aligned_alloc (& alignment, size, allocator) bind(c) use, intrinsic :: iso_c_binding, only : c_ptr, c_size_t integer(c size t), value :: alignment, size $integer(omp_allocator_handle_kind), value :: allocator$

omp_calloc and omp_aligned_calloc [27.11.3-4] [18.13.8] Request a zero-initialized memory allocation from a memory allocator.

void *omp_calloc (size_t nmemb, size_t size,

omp_allocator_handle_t allocator); void *omp_aligned_calloc (size_t alignment, size_t nmemb, size_t size, omp_allocator_handle_t allocator);

Fortran	type(c_ptr), value :: ptr integer(c_size_t), value :: size integer(omp_allocator_handle_kind), value :: & allocator, free_allocator

omp_free [27.12] [18.13.7]

Deallocates previously allocated memory.

C	<pre>void omp_free (void *ptr, omp_allocator_handle_t allocator);</pre>
÷5	void omp_free (void *ptr, omp_allocator_handle_t allocator = omp_null_allocator);
Fortran	subroutine omp_free (ptr, allocator) bind(c) use, intrinsic :: iso_c_binding, only : c_ptr type(c_ptr), value :: ptr integer(omp_allocator_handle_kind), value :: allocator

Lock routines

General-purpose lock routines. Two types of locks are supported: simple locks (svar) and nestable locks (nvar). A nestable lock can be set multiple times by the same task before being unset; a simple lock cannot be set if it is already owned by the task trying to set it.

Initialize lock [28.1.1-2] [18.9.1]

ŧ	<pre>void omp_init_lock (omp_lock_t *svar);</pre>
5	<pre>void omp_init_nest_lock (omp_nest_lock_t *nvar);</pre>
tran	subroutine omp_init_lock (svar) integer (omp_lock_kind) svar
For	subroutine omp_init_nest_lock (nvar) integer (omp_nest_lock_kind) nvar

Initialize lock with hint [28.1.3-4] [18.9.2]

美	<pre>void omp_init_lock_with_hint (omp_lock_t *svar, omp_sync_hint_t hint);</pre>
++)/>	<pre>void omp_init_nest_lock_with_hint (omp_nest_lock_t *nvar, omp_sync_hint_t hint);</pre>
Fortran	subroutine omp_init_lock_with_hint (svar, hint) integer (omp_lock_kind) svar integer (omp_sync_hint_kind) hint
For	subroutine omp_init_nest_lock_with_hint (nvar, hint) integer (omp_nest_lock_kind) nvar integer (omp_sync_hint_kind) hint

hint: See [20.9.5][15.1] in the specification.

Destroy lock [28.2] [18.9.3]

Ensure that the OpenMP lock is uninitialized.

++ 2/ 2	<pre>void omp_destroy_lock (omp_lock_t *svar);</pre>
5	${\bf void\ omp_destroy_nest_lock\ (omp_nest_lock_t\ *\it nvar);}$
tran	subroutine omp_destroy_lock (svar) integer (omp_lock_kind) svar
Fort	subroutine omp_destroy_nest_lock (nvar) integer (omp_nest_lock_kind) nvar

Runtime Library Routines (continued)

Set lock [28.3] [18.9.4]

Sets an OpenMP lock. The calling task region is suspended until the lock is set.

ŧ	<pre>void omp_set_lock (omp_lock_t *svar); void omp_set_nest_lock (omp_nest_lock_t *nvar);</pre>
'	<pre>void omp_set_nest_lock (omp_nest_lock_t *nvar);</pre>
_	

tran	subroutine omp_set_lock (svar) integer (omp_lock_kind) svar
For	subroutine omp_set_nest_lock (nvar) integer (omp_nest_lock_kind) nvar

Unset lock [28.4] [18.9.5]

Unsets an OpenMP lock or decreases the nesting count.

c/C++	<pre>void omp_unset_lock (omp_lock_t *svar);</pre>
5	void omp_unset_nest_lock (omp_nest_lock_t *nvar);
tran	subroutine omp_unset_lock (svar) integer (omp_lock_kind) svar
Fort	subroutine omp_unset_nest_lock (nvar) integer (omp_nest_lock_kind) nvar

Test lock [28.5] [18.9.6]

Attempt to set an OpenMP lock but do not suspend execution of the task executing the routine.

ŧ	<pre>int omp_test_lock (omp_lock_t *svar); int omp_test_nest_lock (omp_nest_lock_t *nvar);</pre>
5	int omp_test_nest_lock (omp_nest_lock_t *nvar);

	logical function omp_test_lock (svar) integer (omp_lock_kind) svar
5	integer (omp_lock_kind) svar

integer function omp_test_nest_lock (nvar) integer (omp_nest_lock_kind) nvar

Thread affinity routines

omp_get_proc_bind [29.1] [18.3.1]

Returns the thread affinity policy to be used for the subsequent nested **parallel** regions that do not specify a proc_bind clause.

	omp_proc_bind_t omp_get_proc_bind (void);
For	integer (omp_proc_bind_kind) & function omp_get_proc_bind ()

Valid return values include: omp_proc_bind_false omp_proc_bind_true omp_proc_bind_primary omp_proc_bind_close omp_proc_bind_spread

omp_get_num_places [29.2] [18.3.2]

Returns the number of places available to the execution environment in the place list.

c/C++	int omp_get_num_places (void);
For	integer function omp_get_num_places ()

omp_get_place_num_procs [29.3] [18.3.3] Returns the number of processors available to the

execution environment in the specified place.

C/C+	<pre>int omp_get_place_num_procs (int place_num);</pre>
rtran	integer function & omp_get_place_num_procs (place_num)
윤	integer place num

omp_get_place_proc_ids [29.4] [18.3.4]

Returns numerical identifiers of the processors available to the execution environment in the specified place.

c/C++	<pre>void omp_get_place_proc_ids (int place_num, int *ids);</pre>
ortran	subroutine omp_get_place_proc_ids(place_num, ids) integer place_num integer ids (*)

omp_get_place_num [29.5] [18.3.5]

Returns the place number of the place to which the encountering thread is bound.

++) /	int omp_get_place_num (void);
For	integer function omp_get_place_num ()

omp_get_partition_num_places [29.6] [18.3.6]

Returns the number of places in the place-partition-var ICV of the innermost implicit task.

c/c	int omp_get_partition_num_places (void);
For	int omp_get_partition_num_places (void); integer function omp_get_partition_num_places ()

omp_get_partition_place_nums [29.7] [18.3.7]

Returns the list of place numbers corresponding to the places in the *place-partition-var* ICV of the innermost implicit task.

C/C+	<pre>void omp_get_partition_place_nums (int *place_nums);</pre>
ŧ	subroutine omp_get_partition_place_nums(& place_nums) integer place_nums (*)

omp_set_affinity_format [29.8] [18.3.8]

Sets the affinity format to be used on the device by setting the value of the affinity-format-var ICV.

C/C	<pre>void omp_set_affinity_format (const char *format);</pre>
For	subroutine omp_set_affinity_format (format) character(len=*), intent(in) :: format

omp_get_affinity_format [29.9] [18.3.9]

Returns the value of the affinity-format-var ICV on the

c/c++	<pre>size_t omp_get_affinity_format (char *buffer,</pre>
For	integer function omp_get_affinity_format (buffer) character(len=*). intent(out) :: buffer

omp_display_affinity [29.10] [18.3.10]

Prints the OpenMP thread affinity information using the format specification provided.

	void omp_display_affinity (const char *format);
For	subroutine omp_display_affinity (format) character(len=*), intent(in) :: format

omp_capture_affinity [29.11] [18.3.11]

Prints the OpenMP thread affinity information into a buffer using the format specification provided.

++2/2	<pre>size_t omp_capture_affinity (char *buffer, size_t size, const char *format)</pre>
Fortran	integer function omp_capture_affinity (buffer, format) character(len=*), intent(out) :: buffer character(len=*), intent(in) :: format

Execution control routines

omp_get_cancellation [30.1] [18.2.8]

Returns true if cancellation is enabled: otherwise it returns false. ICV: cancel-var

c/C++	int omp_get_cancellation (void);
For	logical function omp_get_cancellation ()

omp_pause_resource [30.2.1] [18.6.1] omp pause resource all [30.2.2] [18.6.2]

Allows the runtime to relinquish resources used by OpenMP on the specified device. Valid kind values include, e.g., omp_pause_soft and omp_pause_hard.

++) /2	<pre>int omp_pause_resource (omp_pause_resource_t kind, int device_num);</pre>
/o	<pre>int omp_pause_resource_all (omp_pause_resource_t kind);</pre>
ortran	integer function omp_pause_resource (& kind, device_num) integer (omp_pause_resource_kind) kind integer device_num
4	integer function omp_pause_resource_all (kind) integer (omp_pause_resource_kind) kind

omp_display_env [30.4] [18.15]

Displays the OpenMP version number and the initial values of ICVs associated with environment variables.

C/C++	void omp_display_env (int verbose);
For	subroutine omp_display_env (verbose) logical, intent(in) :: verbose

Timing routines

Timing routines support a portable wall clock timer. These record elapsed time per-thread and are not guaranteed to be globally consistent across all the threads participating in an application.

omp_get_wtime [30.3.1] [18.10.1]

Returns elapsed wall clock time in seconds.

++) /ɔ	double omp_get_wtime (void);
For	double precision function omp_get_wtime ()

omp_get_wtick [30.3.2] [18.10.2]

Returns the precision of the timer (seconds between ticks) used by omp_get_wtime.

C/C++	double omp_get_wtick (void);
For	double precision function omp_get_wtick ()

Tool support routine

omp_control_tool [31.1] [18.14]

Enables a program to pass commands to an active tool.

++ 2/ 2	<pre>omp_control_tool_result_t omp_control_tool (omp_control_tool_t command, int modifier, void *arg);</pre>
Fortran	integer (omp_control_tool_result_kind function & omp_control_tool (command, modifier) integer (omp_control_tool_kind) command integer modifier

command:

omp control tool start

Start or restart monitoring if it is off. If monitoring is already on, this command is idempotent. If monitoring has already been turned off permanently, this command will have no effect.

omp_control_tool_pause

Temporarily turn monitoring off. If monitoring is already off, it is idempotent.

omp control tool flush

Flush any data buffered by a tool. This command may be applied whether monitoring is on or off.

omp_control_tool_end

Turn monitoring off permanently; the tool finalizes itself and flushes all output.

Environment Variables

Environment variable names are upper case. The values assigned to them are case insensitive and may have leading and trailing white space.

OMP AFFINITY FORMAT format [4.3.5] [21.2.5]

Sets the initial value of the *affinity-format-var* ICV defining the format when displaying OpenMP thread affinity information. The *format* is a character string that may contain as substrings one or more field specifiers, in addition to other characters. The value is case-sensitive, and leading and trailing whitespace is significant. The format of each field specifier is: %[[[0].]size]type, where the field type may be either the short or long names listed below [Table 21.2] [21.2].

t	team_num	n	thread_num
T	num_teams	N	num_threads
L	nesting_level	а	ancestor_tnum
Р	process_id	Α	thread_affinity
Н	host	i	native_thread_id

OMP ALLOCATOR allocator [4.4.1] [21.5.1]

OpenMP memory allocators can be used to make allocation requests. This environment variable sets the initial value of def-allocator-var ICV that specifies the default allocator for allocation calls, directives, and clauses that do not specify an allocator. The value is a predefined allocator or a predefined memory space optionally followed by one or more allocator traits.

- Predefined memory spaces are listed in Table 8.1 6.1
- Allocator traits are listed in Table 8.2 6.2
- Predefined allocators are listed in Table 8.3 6.3

Examples

export OMP_ALLOCATOR=omp_high_bw_mem_alloc export OMP_ALLOCATOR="omp_large_cap_mem_space: \ alignment=16, pinned=true"

export OMP_ALLOCATOR="omp_high_bw_mem_space:\
pool_size=1048576, fallback=allocator_fb, \
fb_data=omp_low_lat_mem_alloc"

Memory	space	names	
--------	-------	-------	--

[Table 8.1 6.1]

omp_default_mem_space omp_ omp_large_cap_mem_space omp_ omp_const_mem_space

omp_high_bw_mem_space omp_low_lat_mem_space

Allocator traits & allowed values [Table 8.2 6		[Table 8.2 6.2]	
sync_hint	contended, uncontended, serialized,	orivate	
alignment	1 byte; Positive integer value that is a power of 2		
access	all, cgroup, pteam, thread		
pool_size	Positive integer value (Default impleme	entation defined)	
fallback	default_mem_fb, null_fb, abort_fb, allocator_fb		
fb_data	An allocator handle (No default)		
pinned	true, false (Default is false)		
partition	environment, nearest, blocked, interle (Default is environment)	eaved	
pin_device	Conforming device number (No defaul	t)	
preferred_device	Conforming device number (No defaul	t)	
target_access	single, multiple (Default is single)		
atomic_scope	all, device (Default is device)		
part_size	Positive integer value (Default impleme	ntation defined)	
partitioner	A memory partitioner handle (No defa	ult)	
partitioner_arg	An integer value (Default is 0)		

Predefined allocators, memory	space, and trait values [Table 8.3 6.3]		
omp_default_mem_alloc	omp_default_mem_space fallback:null_fb		
omp_large_cap_mem_alloc	omp_large_cap_mem_space (none)		
omp_const_mem_alloc	omp_const_mem_space (none)		
omp_high_bw_mem_alloc	omp_high_bw_mem_space (none)		
omp_low_lat_mem_alloc	omp_low_lat_mem_space (none)		
omp_cgroup_mem_alloc	Implementation defined access:cgroup		
omp_pteam_mem_alloc	Implementation defined access:pteam		
omp_thread_mem_alloc	Implementation defined access:thread		

OMP_AVAILABLE_DEVICES list [4.3.7]

Sets the available-devices-var ICV and determines the available non-host devices and their device numbers. The value of *list* must be a comma-separated list of trait specifications or *, where * represents all remaining devices. Each list item expands to a set of matching devices that are supported and accessible and do not match a prior list item. Device numbers are assigned to the resulting devices in order.

OMP_CANCELLATION cancelstate [4.3.6] [21.2.6]

Sets the initial value of the *cancel-var* ICV to *cancelstate*, which must be **true** or **false**. If **true**, the effects of the **cancel** construct and of cancellation points are enabled and cancellation is activated.

OMP_DEBUG debugstate [4.6.1] [21.4.1]

Sets the *debug-var* ICV to *debugstate*. The value must be **enabled** or **disabled**. If **enabled**, the OpenMP implementation collects additional runtime information to be provided to a third-party tool. If **disabled**, only reduced functionality might be available in the debugger.

OMP_DEFAULT_DEVICE device [4.3.8] [21.2.7]

Sets the initial value of the *default-device-var* ICV that controls the default device number to use in device constructs.

OMP_DISPLAY_AFFINITY var [4.3.4] [21.2.4]

Instructs the runtime to display formatted affinity information for all OpenMP threads in the parallel region. The information is displayed upon entering the first parallel region and when there is any change in the information accessible by the format specifiers listed in the table for <code>OMP_AFFINITY_FORMAT</code>. If there is a change of affinity of any thread in a parallel region, thread affinity information for all threads in that region will be displayed. <code>var</code> may be <code>true</code> or <code>false</code>.

OMP_DISPLAY_ENV var [4.7] [21.7]

If var is **true**, instructs the runtime to display the OpenMP version number and the value of the ICVs associated with the environment variables as name=value pairs. If var is **terbose**, the runtime may also display vendor-specific variables. If var is **false**, no information is displayed.

OMP_DYNAMIC var [4.1.2] [21.1.1]

Sets the initial value of the *dyn-var* ICV. *var* may be **true** or **false**. If **true**, the implementation may dynamically adjust the number of threads to use for executing **parallel** regions.

OMP_MAX_ACTIVE_LEVELS levels [4.1.5] [21.1.4]

Sets the initial value of the *max-active-levels-var* ICV that controls the maximum number of nested active **parallel** regions.

OMP_MAX_TASK_PRIORITY level [4.3.11] [21.2.9]

Sets the initial value of the $\it max$ -task-priority-var ICV that controls the use of task priorities.

OMP_NUM_TEAMS number [4.2.1] [21.6.1]

Sets the maximum number of teams created by a **teams** construct by setting the *nteams-var* ICV.

OMP_NUM_THREADS | ist [4.1.3] [21.1.2]

Sets the initial value of the *nthreads-var* ICV for the number of threads to use for **parallel** regions.

OMP_PLACES places [4.1.6] [21.1.6]

Sets the initial value of the *place-partition-var* ICV that defines the OpenMP places available to the execution environment. *places* is an abstract name (threads, cores, sockets, II_caches, numa_domains) or an ordered list of places where each place of brace-delimited numbers is an unordered set of processors on a device.

OMP_PROC_BIND policy [4.1.7] [21.1.7]

Sets the initial value of the global *bind-var* ICV, setting the thread affinity policy to use for **parallel** regions at the corresponding nested level. *policy* can have the values **true**, **false**, or a comma-separated list of **primary**, **close**, or **spread** in quotes.

Page 18

OMP_SCHEDULE [modifier:]kind[, chunk] [4.3.1] [21.2.1] Sets the run-sched-var ICV for the runtime schedule kind and chunk size. modifier is one of monotonic or nonmonotonic; kind is one of static, dynamic, guided, or auto.

OMP_STACKSIZE size[unit] [4.3.2] [21.2.2]

Sets the *stacksize-var* ICV that specifies the size of the stack for threads created by the OpenMP implementation. The value of *size* is a positive integer that specifies stack size. The value of *unit* indicates the unit of measurement, where **B** is bytes, **K** is kilobytes, **M** is megabytes, and **G** is gigabytes. If unit is not specified, *size* is in units of **K**.

OMP_TARGET_OFFLOAD state [4.3.9] [21.2.8]

Sets the initial value of the *target-offload-var* ICV. The value of *state* must be one of **mandatory**, **disabled**, or **default**.

OMP_TEAMS_THREAD_LIMIT number [4.2.2] [21.6.2]

Sets the maximum number of OpenMP threads to use in each contention group created by a **teams** construct by setting the *teams-thread-limit-var* ICV.

OMP_THREAD_LIMIT limit [4.1.4] [21.1.3]

Sets the maximum number of OpenMP threads to use in a contention group by setting the *thread-limit-var* ICV.

OMP_THREADS_RESERVE list [4.3.10]

Controls the number of structured threads and free-agent threads to reserve in a contention group by accordingly setting the structured-thread-limit-var and free-agent-thread-limit-var ICVs. The value of list is a commaseparated list of reservations, where a reservation is **n**, **structured**[(n)], or **free_agent**[(n)] and where n is a non-negative integer.

OMP_TOOL *toolstate* [4.5.1] [21.3.1]

Sets the *tool-var* ICV. If disabled, no first-party tool will be activated. If enabled the OpenMP implementation will try to find and activate a first-party tool. The value of *toolstate* may be **enabled** or **disabled**.

OMP_TOOL_LIBRARIES library-list [4.5.2] [21.3.2]

Sets the *tool-libraries-var* ICV to a list of tool libraries that will be considered for use on a device where an OpenMP implementation is being initialized. *library-list* is a space-separated list of dynamically-linked libraries, each specified by an absolute path.

OMP_TOOL_VERBOSE_INIT value [4.5.3] [21.3.3]

Sets the *tool-verbose-init-var* ICV, which controls whether an OpenMP implementation will verbosely log the registration of a tool. The value of *value* must be a filename or one of **disabled**, **stdout**, or **stderr**.

OMP_WAIT_POLICY policy [4.3.3] [21.2.3]

Sets the wait-policy-var ICV that provides a hint to an OpenMP implementation about the desired behavior of waiting threads. policy may be active (waiting threads consume processor cycles while waiting) or passive. The default is implementation defined.

Internal Control Variables (ICV) Values

Host and target device ICVs are initialized before OpenMP API constructs or routines execute. After initial values are assigned, the values of environment variables set by the user are read and the associated ICVs for host and target devices are modified accordingly. Certain environment variables may be extended with device-specific environment variables with the following syntax: <ENV_VAR>_DEV[_<device_num>]. Device-specific environment variables must not correspond to environment variables that initialize ICVs with the global scope.

Page 19

Table of ICV Initial Values, Ways to Modify and to Retrieve ICV Values, and Scope [Tables 3.1-3] [Tables 2.1-3]

ICV	Environment variable	Initial value	Ways to modify value	Ways to retrieve value	Scope
active-levels-var	(none)	zero	(none)	omp_get_active_level()	Data env.
affinity-format-var	OMP_AFFINITY_FORMAT [4.3.5] [21.2.5]	Implementation defined.	omp_set_affinity_format()	omp_get_affinity_format()	Device
available-devices-var	OMP_AVAILABLE_DEVICES [4.3.7]	The set of all supported and accessible devices.	(none)	(none)	Global
bind-var	OMP_PROC_BIND [4.1.7] [21.1.7]	Implementation defined.	(none)	omp_get_proc_bind()	Data env.
cancel-var	OMP_CANCELLATION [4.3.6] [21.2.6]	False	(none)	omp_get_cancellation()	Global
debug-var	OMP_DEBUG [4.6.1] [21.4.1]	disabled	(none)	(none)	Global
def-allocator-var	OMP_ALLOCATOR [4.4.1] [21.5.1]	Implementation defined.	omp_set_default_allocator()	omp_get_default_allocator()	Impl. Task
default-device-var	OMP_DEFAULT_DEVICE [4.3.8] [21.2.7]	Implementation defined.	omp_set_default_device()	omp_get_default_device()	Data env.
device-num-var	(none)	Zero	(none)	omp_get_device_num()	Device
display-affinity-var	OMP_DISPLAY_AFFINITY [4.3.4] [21.2.4]	False	(none)	(none)	Global
dyn-var	OMP_DYNAMIC [4.1.2] [21.1.1]	Implementation-defined if the implementation supports dynamic adjustment of the number of threads; otherwise, the initial value is false.	omp_set_dynamic()	omp_get_dynamic()	Data env.
explicit-task-var	(none)	False	(none)	omp_in_explicit_task()	Data env.
final-task-var	(none)	False	(none)	omp_in_final()	Data env.
free-agent-thread-limit-var	OMP_THREAD_LIMIT [4.1.4] [21.1.3] OMP_THREADS_RESERVE [4.3.10]	One less than the initial value of thread-limit-var.	(none)	(none)	Data env.
free-agent-var	(none)	False	(none)	omp_is_free_agent()	Data env.
league-size-var	(none)	One	(none)	omp_get_num_teams()	Data env.
levels-var	(none)	Zero	(none)	omp_get_level()	Data env.
max-active-levels-var	OMP_MAX_ACTIVE_LEVELS [4.1.5] [21.1.4] OMP_NUM_THREADS [4.1.3] [21,1,2] OMP_PROC_BIND [4.1.7] [21.1.7]	Implementation defined.	omp_set_max_active_levels()	omp_get_max_active_levels()	Data env.

tool-verbose-init-var	OMP_TOOL_VERBOSE_INIT [4.5.3] [21.3.3]	Disabled	(none)	(none)	Global

Using OpenMP Tools

A tool indicates its interest in using the OMPT interface by providing a non-null pointer to an ompt_start_tool_result_t structure to an OpenMP implementation as a return value from the ompt_start_tool function. There are three ways that a tool can provide a definition of ompt_start_tool to an OpenMP implementation:

- Statically linking the tool's definition of ompt_start_tool into an OpenMP application.
- Introducing a dynamically linked library that includes the tool's definition of ompt_start_tool into the application's address space.

 Providing the name of a dynamically linked library appropriate for the architecture and operating system used by the application in the tool-libraries-var ICV (via omp_tool_libraries).

You can use **omp_tool_verbose_init** to help understand issues with loading or activating tools. This runtime library routine sets the *tool-verbose-init-var* ICV, which controls whether an OpenMP implementation will verbosely log the registration of a tool.

Become an OpenMP ARB Member

The strength of the OpenMP Architecture Review Board (ARB) comes from its diverse membership.

Companies both large and small with products that depend on the OpenMP API are invited to join the OpenMP ARB, as are other organizations with interest in the evolution of the OpenMP API.

OpenMP ARB provides members with Developer Resources, API Influence, Access to the API Roadmap, Co-marketing Opportunities, OpenMP Community Participation , and the right to use OpenMP trademarks and logos to promote your OpenMP API-related products, services, and research.
